LEARNING DIARY, SOFTWARE DEVELOPMENT SKILLS: FRONT-END 2020-21

26.7.2021

Today was all about the transitions, the rotation of the button both in css and JavaScript. There wasn't much else, but I did have a lot of problems due to a very small writing error that did not highlight as an error but still stopped the program from working properly. I did find the error on my own thought and it was an easy fix once found.

27.7.2021

The menu overlay was simple enough so that I managed it without any large issues. There was a good combination of the previous topics. Such as transitions and overlays and a lot of designing if I was not following instructions but instead creating my own work.

28.7.2021

Today I created a function to adjust the text color based on the background. Also learned about the use of the grid and how to adjust it to different screen sizes. There were a few problems with the background on the about page that I also made but nothing too hard to handle.

29.7.2021

The second to last day was already kind of easy. Basically nothing new but a lot of useful repetition of previously learned subjects. The flexbox was the only new thing but it was very simple and did not take much to understand the basics of it.

03.8.2021

Today I completed the final project for the course I finally felt that I truly understand how sass really works. Of course there is still much I do not know and that comes with practice but the parts where during the lectures I was just doing as instructed are now clear. The site has now been deployed and is ready.
